SWASTHYA SENSE

3-Minute Hackathon Pitch Script

Theme: Early Warning & Follow-up for High-Risk Patients
Target duration: 180 seconds
Delivery tip: Speak clearly, demonstrate only working features, and keep the demo data fictional.

[0:00–0:30] 1. The Problem

(Show the application login screen.)

Respected judges,

Imagine a health worker responsible for dozens of patients who need regular medical follow-ups. One patient misses a check-up. Another reports a concerning symptom. A third has been referred to a doctor, but nobody knows whether the follow-up was completed.

With multiple patients and limited time, keeping track of every case becomes difficult.

The problem is not just missed appointments. It’s making sure the right patient gets attention at the right time.

That is why we built SWASTHYA SENSE.

[0:30–1:00] 2. Our Solution

(Show the frontline health worker dashboard.)

SWASTHYA SENSE is an early-warning and follow-up platform designed to support frontline health workers.

Our dashboard organizes patients into three clear categories: patients requiring clinical review, missed follow-ups, and routine checks.

Instead of searching through multiple records, workers can quickly identify pending tasks, understand why a case is flagged, and take the next appropriate action.

Our core principle is simple: make healthcare follow-ups easier, more transparent, and more accountable.

[1:00–2:00] 3. Live Demonstration

(Open a fictional patient record.)

Let’s look at a fictional patient, Ramesh, who has a scheduled follow-up.

First, our system identifies that his appointment is overdue and prompts the health worker to contact him.

Now, let’s record a new check-in.

(Demonstrate the check-in and alert rule.)

Suppose Ramesh reports information that matches one of our configured warning rules. SWASTHYA SENSE explains why the case has been flagged and prompts the health worker to escalate it for clinical review.

(Switch to the clinician dashboard.)

The clinician can review the reported information, record a decision, and determine the appropriate next step.

Finally, our system records the escalation and review activity so the case can be tracked.

[2:00–2:35] 4. Technical Design and Privacy

(Show the architecture or audit dashboard.)

Technically, our platform connects a user-friendly frontend to a backend that manages patient records, follow-up schedules, and configurable alert rules.

Our rule-based approach makes alerts explainable instead of relying on an opaque prediction.

Role-based access restricts information according to user responsibilities, while consent controls and audit logs support responsible data handling.

We use synthetic patient records for our demonstration, and the system supports clinical review rather than independently diagnosing diseases or prescribing treatment.

[2:35–3:00] 5. Impact and Closing

(Face the judges.)

Our goal is to help frontline health workers manage their workload, identify missed follow-ups, and ensure that concerning cases reach qualified clinicians.

SWASTHYA SENSE is designed to make patient follow-up more organized, transparent, and reliable.

Because sometimes, the most important healthcare intervention is making sure that someone who needs attention is not forgotten.

We don’t replace healthcare workers. We help them see who needs attention, understand why, and act in time.

Thank you. We welcome your questions.

Before presenting: Keep only claims that match your working application. Demonstrate offline sync, consent controls, and audit logging only if they are implemented and tested.
